

# THERMADEK WINTER GRADE

**The Client:** Davyhulme WWTW.

**The Applicator:** Sureseal Limited.

**The Problem:** Insulation required to 8 tank tops, approximately 500m<sup>2</sup> each, over a 3-year period with each tank being made available at fairly short notice and at different times of the year, which resulted in some of the tanks being sprayed in the winter months. This created the problem of the surface temperature frequently being below 5°C. The standard Thermadek 40 system was unsuitable in these conditions as the surface was too cold to achieve the correct reaction from the foam.

**The Solution:** Isothane Ltd was contacted to see if they could supply material that would spray at temperatures below 5°C. A suitable system was offered that would allow the contract to carry on throughout the winter months –  
**Thermadek Winter Grade.**

**The Outcome:** The product development was progressed in a matter of days, and the modified system performed in line with expectations and enabled the contract to be successfully completed on time.

Insulation required to 8 tank tops, with some of the tanks being sprayed in the winter months below 5°C. Successful product development and application achieved in a matter of days.
